

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (currently amended): A method of tracking and synchronizing content across multiple devices, including a plurality of client devices and a server, comprising:
 - receiving new content within a request submitted by [[from]] a user;
 - reviewing specific content within said new content in response to the request and comparing with duplicate or related content which is available across any of the multiple devices;
 - performing the request and creating a new content record corresponding to said new content;
 - automatically completing fields within said new content record based on information contained in the specific content as well as information about the presence of duplicate or related content which is available across the multiple devices;
 - wherein new content without an existing record is compared with existing content having a corresponding record, and if the new content is at least similar to existing content, then the records from the existing content are utilized in completing the fields of the new content; and
 - updating the records of duplicate or related content with information about the specific content associated with said new content record to synchronize all the content records.

2. (previously presented): A method as recited in claim 1, further comprising:
 - receiving a copy, delete, or print request from a user corresponding to said specific content wherein duplicates of said specific content, or related to said specific

content, are retained across multiple devices configured for communicating with one another over a network;

reviewing a record associated with the specific content in response to the request and analyzing the associated record to determine what duplicate or related content is available across the multiple devices;

transmitting a confirmation for the request in response to detecting the presence of any duplicate or related content; and

performing the request in response to receiving the request and instructions from the user in responding to said confirmation.

3. (previously presented): A method as recited in claim 1, further comprising:
receiving a copy, delete, or print request from a user corresponding to said specific content wherein duplicates of said specific content, or related to said specific content, are retained across multiple devices configured for communicating with one another over a network;

reviewing a record associated with the specific content in response to the request and analyzing the associated record to determine what duplicate or related content is available across the multiple devices; and

determining utilization of any duplicate or related content based on a pre-established preference and the type of request which was received.

4. (previously presented): A method as recited in claim 2, wherein said confirmation presents the user with options as to which content to use for performing said request based on the presence of duplicate or related content.

5. (previously presented): A method as recited in claim 1, wherein said specific content includes one from the group of content items consisting of a photograph, music, a document, and a video.

6. (previously presented): A method as recited in claim 1, wherein each content record includes a field for related content.

7. (previously presented): A method as recited in claim 3, further comprising storing the preference in a storage device.

8. (previously presented): A method as recited in claim 1, further comprising storing the record in a storage device.

9. (previously presented): A method as recited in claim 2, wherein the confirmation asks the user for authorization for executing the request.

10. (previously presented): A system for tracking and synchronizing content across multiple devices, including a plurality of client devices and a server, comprising:
means for receiving a request from a user to create a new content record for new content received;

means for reviewing specific content within the new content of said new record in response to the request and comparing with duplicate or related content which is available across said multiple devices;

means for performing the request and creating a record corresponding to said new content;

means for automatically completing said new content record in response to information contained in the specific content as well as information about said duplicate or related content which is available across the multiple devices; and

means for updating the records of duplicate or related content with information about the specific content associated with said new content record to synchronize the content records.

Claims 11-16 (canceled).

17. (previously presented): A system for tracking and synchronizing content across multiple devices, including a plurality of client devices and a server, comprising:

- an interface module configured for receiving a request specifying content;
- said interface module is configured for communicating over a network between one or more client devices and a server device;
- said specific content along with existing duplicate content, and/or related content are retained across multiple devices configured for communicating over the network;
- wherein a content record is associated with each specific content, with said content record having information fields for accessing the duplicate content and/or related content;
- a storage module configured for storing a preference wherein the preference corresponds to types of request and includes at least one criteria for performing the request;
- a review module configured for analyzing the specific content and a corresponding content record associated with the request, to find duplicate or related content that is available across the system containing the multiple devices;
- said review module also automatically updates content record fields associated with existing content in response to receipt of new content which is found to be a duplicate or related to the existing content;
- said review module configured for selectively transmitting a confirmation for the request based on the analysis and the presence of duplicate or related content and the preference for determining whether the request is performed; and
- said review module executes the request based on receiving the request and instruction from the user in responding to said confirmation.

18. (previously presented): A system as recited in claim 17, further comprising a capture module configured to identify the content.

19. (previously presented): A system as recited in claim 17, wherein the content includes one from the group of content items consisting of a photograph, music, a document, and a video.

20. (previously presented): A system as recited in claim 17, wherein the interface module is configured to provide a confirmation based on the criteria for performing the request as contained in said preference, said confirmation configured for confirming that the user desires to proceed with performing the request.

21. (previously presented): A system as recited in claim 17, wherein the storage module is configured to store the record.

22. (previously presented): A system as recited in claim 17, wherein the storage module is configured to store the content.

23. (previously presented): A system as recited in claim 17, wherein the request includes one from the group of request types consisting of saving, deleting, modifying, and printing of the content.

24. (previously presented): A computer-readable medium having computer executable instructions for performing a tracking and synchronization method across multiple devices, including a plurality of client devices and a server, comprising:

receiving a request from a user corresponding to a specific content wherein duplicates of said specific content, or related to said specific content, are retained across multiple devices configured for communicating with one another over a network;

wherein a content record is associated with each specific content, with said content record having information fields for accessing the duplicate content and/or related content;

reviewing a record associated with the specific content in response to the request and analyzing the associated record to determine what duplicate or related content is available across the multiple devices;

automatically updating content record fields associated with existing content in response to receipt of new content which is found to be a duplicate or related to the existing content;

selectively transmitting a confirmation for the request based on said reviewing and the presence of any duplicate or related content;

performing the request based on receiving the request and instruction from the user in responding to said confirmation.

25. (previously presented): A system for synchronizing and tracking content across multiple devices, including a plurality of client devices and a server, comprising:
a server configured for communication over a network;
a client device configured for communication over the network with said server;
an electronic processor in said client device, said server, or in both said client device and said server; and
programming executable on said electronic processor for,
receiving a request specifying specific content,
communicating over the network between said client device and said server device and at least one other client device connected to the network,
said specific content along with existing duplicate content, and/or related content are retained across multiple client devices configured for communicating over the network,

wherein a content record is associated with each specific content, with said content record having information fields for accessing the duplicate content and/or related content,

analyzing the specific content and a corresponding content record associated with the specific content in response to said request to find duplicate or related content that is available on devices connected to the network,

automatically updating content record fields associated with existing content in response to receipt of new content which is found to be a duplicate or related to the existing content,

transmitting a confirmation for the request when duplicate or related content is available,

receiving instruction from the user in responding to said confirmation, executing the request based on instruction.

26. (previously presented): A system for synchronizing and tracking content across multiple devices, including a plurality of client devices and a server, comprising:
a server configured for communication over a network;
a client device configured for communication over the network with said server;
an electronic processor in said client device, said server, or in both said client device and said server; and
programming executable on said electronic processor for,
storing a preference setting for one or more types of requests, said preference including at least one criteria for performing the request;
receiving a request from a user specifying specific content,
communicating over the network between said client device and said server and at least one other client device connected to the network,

said specific content along with existing duplicate content, and/or related content are retained across multiple client devices configured for communicating over the network,

wherein a content record is associated with each specific content, with said content record having information fields for accessing the duplicate content and/or related content,

analyzing the specific content and a corresponding content record associated with the specific content in response to said request to find duplicate or related content that is available on devices connected to the network,

automatically updating content record fields associated with existing content in response to receipt of new content which is found to be a duplicate or related to the existing content,

transmitting a confirmation for the request based on the preference setting when duplicate or related content is available,

receiving instruction from the preference setting, and/or from the user in responding to said confirmation, as to how to execute said request,

executing the request in response to said instruction.

27. (previously presented): An apparatus for synchronizing and tracking content across multiple devices, including a plurality of client devices and a server, comprising:

a client device configured for communication over the network with a server and/or at least one other client device;

an electronic processor in said client device; and

programming executable on said electronic processor for,

receiving a request specifying specific content,

communicating over the network between said client device and a server and/or at least one other client device connected to the network,

said specific content along with existing duplicate content, and/or related content are retained across the server and/or multiple client devices configured for communicating over the network,

wherein a content record is associated with each specific content, with said content record having information fields for accessing the duplicate content and/or related content,

analyzing the specific content and a corresponding content record associated with the specific content in response to said request to find duplicate or related content that is available on servers and/or client devices connected to the network,

automatically updating content record fields associated with existing content in response to receipt of new content which is found to be a duplicate or related to the existing content,

transmitting a confirmation for the request when duplicate or related content is available,

receiving instruction from the user in responding to said confirmation, executing the request based on said instruction.

28. (previously presented): An apparatus for synchronizing and tracking content across multiple devices, including a plurality of client devices and a server, comprising: a server configured for communication over a network with client devices; an electronic processor in said server; and programming executable on said electronic processor for, receiving a request specifying specific content, communicating over the network between said server and at least one said client device connected to the network,

said specific content along with existing duplicate content, and/or related content are retained across said server and at least one said client device configured for communicating over the network,

wherein a content record is associated with each specific content, with said content record having information fields for accessing the duplicate content and/or related content,

analyzing the specific content and a corresponding content record associated with the specific content in response to said request to find duplicate or related content that is retained on client devices connected to the network,

automatically updating content record fields associated with existing content in response to receipt of new content which is found to be a duplicate or related to the existing content,

transmitting a confirmation for the request when duplicate or related content is available,

receiving instruction from the user in responding to said confirmation, executing the request based on said instruction.
